

Tree stands approximately 14m high with an 8m width from crown centre on the East round to South sections of the crown.

After the intended works there would be a residual width of no less than 6m from crown centre. Minor reducing works to be carried out on the upper crown to shape and balance. Up to 1m, leaving a residual height of 13m.

Suppressed crown on the Western side from adjacent Oak. Works are for general upkeep and maintenance and to maintain at a certain size for the location. Reducing this side would also help with weight balancing.

Works would not be detrimental nor affect the amenity value.
