

At present, there is approximately 3.5m clearance to ground level at lowest point. After the removal of specific limbs to gain another 2.5m clearance. There would be a ground clearance of 6m.

Main reasons for works are to remove branches interfering with BT cables running underneath. 1 limb is in contact with 2 more on roadside making contact in windy conditions.

Remaining 2 limbs to be removed would be to level out the crown lift with the other limb being dead.
