

Tree stand approximately 18m tall with a crown width from centre of 5 to 6m on all sides.

Tree is located at the entrance of the property with an approximate lean towards the property of 10 to 15 degrees. Has been reported that the tree has been shedding limbs in high winds.

Client has growing concerns that tree is becoming dangerous and unstable and that the lean has started to increase. The tarmac on the Eastern section has started to crack and lift as shown in the pictures. Although no visible damage or cracks on adjacent wall.

The long-term future for the tree is questionable due to its location and I believe it does pose a reasonable risk to surroundings and residents.
