

This would be the second visit to this tree this year. The works that was carried out last time were to the Eastern round to Southern section of the crown with minor work to top to shape.

Work was carried out on 10/10/25 and completed under **AWDM/0896/25**.

Now neighbouring parties would like the remainder reduced to match previous works.

Tree stands approximately 13m high with a 7.5m width from crown centre on the Northern round to Eastern section of the crown. Crown on Western section only extends 3m at most. Minor works on this section with exception of shaping and blending of corners and removing epicormic growth to crown break.

After the intended works there would be a residual width of no less than 6m from crown centre on the North round to Eastern section. Minor reducing works to be carried out on the upper crown to shape and balance.

Suppressed crown on the Western side from adjacent Oak. Works are for general upkeep and maintenance and to maintain at a certain size for the location. Reducing this side would also help with weight balancing.

Works would not be detrimental nor affect the amenity value.
